1. Getting Started

TradingView is the most widely used charting platform in the world, trusted by both retail traders and institutional professionals. The free account is powerful enough for most traders starting out.

Feature	Free Account	Pro Account
Charts open at once	1	2-8
Indicators per chart	3	5-25
Price alerts	1	20-400
Replay mode	Limited	Full access
Saved chart templates	Limited	Unlimited
Data delay	15-20 minutes	Real-time

2. Chart Setup

Choose Your Symbol

Type any ticker in the search bar at the top. Stocks: AAPL, NVDA. Crypto: BTCUSDT, ETHUSDT. Forex: EURUSD. TradingView covers virtually every tradable asset globally across all exchanges.

Set Your Timeframe

Each candle represents a time period. 1D = daily, 4H = 4-hour, 1H = 1-hour, 15m = 15-minute. Start with the daily chart for overall context, then zoom into shorter timeframes for precise entries.

Chart Type

Always use Candlesticks — they show Open, High, Low, and Close. Bar charts show the same data. Line charts only show close prices and lose important information about price action within the period.

Color Theme

Go to Settings (gear icon) then Appearance to set your preferred color scheme. Many professionals use dark mode to reduce eye strain during long analysis sessions.

3. Key Indicators to Add

Click Indicators at the top or press / to open the library. Search by name. These five form a complete analysis toolkit:

Indicator	Settings	Purpose
RSI	Length 14, OB 70, OS 30	Identify overbought/oversold and divergences

MACD	12 / 26 / 9	Trend direction and momentum shifts
Moving Average	50-period SMA and 200-period SMA	Primary trend and key levels
Bollinger Bands	20 period, 2 std dev	Volatility context and price extremes
Volume	Default	Confirm strength of every price move

4. Drawing Tools

Horizontal Line (H)

The most important drawing tool. Mark support and resistance levels where price has previously reversed multiple times. These levels act as magnets for price and are watched by all professional traders.

Trend Line

Connect swing lows in an uptrend or swing highs in a downtrend. A confirmed break of the trend line is often an early warning signal of a trend reversal.

Fibonacci Retracement

After a significant move, draw from swing low to swing high. The 0.618 and 0.786 levels are the strongest retracement levels — often where the trend resumes after a pullback.

Rectangle / Box

Mark consolidation zones between two price levels. A breakout from a well-defined box is a significant signal, especially on high volume.

5. Setting Price Alerts

Alerts notify you when price reaches a specific level — you do not need to watch charts constantly. This is one of TradingView's most practical features.

- Right-click on your chart at the exact price level you want to monitor
- Select "Add Alert" from the context menu
- Choose the condition: price crosses, rises above, or falls below your level
- Set notification method: pop-up window, email, or SMS (Pro feature)
- Add a brief note describing what this alert means to you
- Set your alerts at key levels before you go to sleep — let markets work for you

Pro Tip

Set alerts at both your stop loss level and your take profit target before entering any trade. This forces you to define your exit plan in advance and eliminates emotional decision-making during volatile price moves.
